Fiberfriläggning, kvalitetssäkring och fiberanvändning

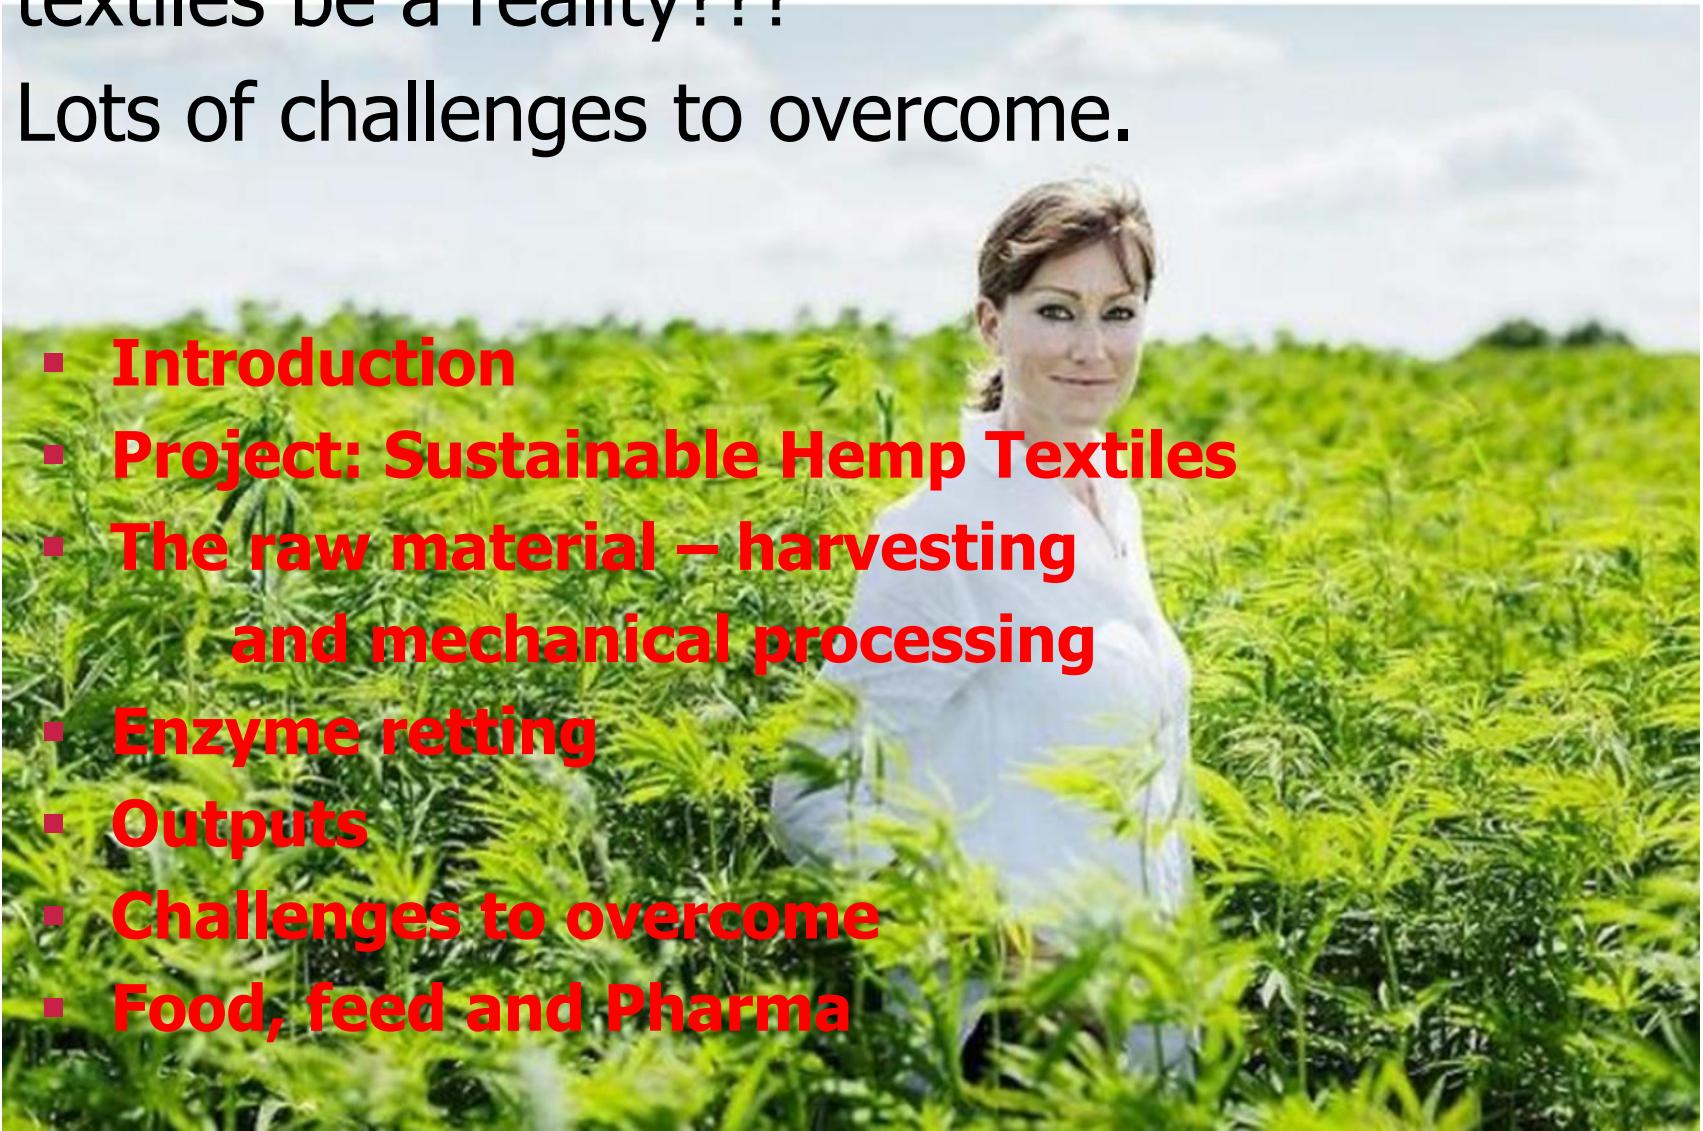

Worksop svensk Agrofiber 26 June 2018 Bodil Engberg
Pallesen, DTI

Will a Nordic production of sustainable hemp textiles be a reality???

Lots of challenges to overcome.

- **Introduction**
- **Project: Sustainable Hemp Textiles**
- **The raw material – harvesting and mechanical processing**

Biomaterialer - Produktudvikling ud fra plantefibre og restmaterialer

Foto: Martin Håkan / Coverganda.dk

Udslip af drivhusgasser, mangel på råvarer samt affalds- og forureningsproblematikker udgør en stigende trussel for vores klima. Forbrugere og virksomheder efterspørger derfor også innovative biomaterialer som aldrig før, og der er stor fokus på cirkulær økonomi, bioøkonomi og bæredygtighed.

Biobaserede produkter er bionedbrydelige og mindre forurenende, fordi de giver mindre affald, kan recirkuleres og udleder mindre CO₂ ved fremstilling. Foruden miljømæssige fordele kan produkterne endda have bedre tekniske egenskaber med hensyn til styrke, lethed og isoleringsevne. Plantefibre fx er velegnede til brug i

It started with hemp - a multi functionel plant

Experience

- More than 20 years of experience in the sector, worked with development and testing of new products made from plant fibers
- Development work started at the former “Danish Agricultural Advisory Service, National Center, Department of Crop Production” – now SEGES and continued at AgroTech (from 2007) and now Technological Institute, AgroTech division (from 2016)
- Developed fibermats from hemp for insulation, growth mats, composites etc.

Development work in cooperation with Advance Nonwoven a.o.

Project: Concept for production of sustainable hemp textiles

Supported by Danish Agency of Environment (www.mudp.dk)

Project period: Autumn 2017 – ultimo 2020

Consortium/Partners:

- Advance Nonwoven www.advancenonwoven.dk
- Jørgen Heggelund, Vittenbjerggård www.vittenbjerg.dk
- Danish Technological Institute (DTI) www.dti.dk
- Kvadrat www.kvadrat.dk
- Rachel Kollerup www.rachelkollerup.com

rachel kollerup

Focus from Fashion Industry etc.: Textile production is not sustainable - especially not cotton

Cotton grown in the 3 world are sprayed up 70 times each season due to severe problems with pests and weed. Cotton production is only around 2.5 per cent of the total agricultural area worldwide, but accounts for 25 percent of total consumption of insecticides and 10 percent of total pesticide consumption!

http://wwf.panda.org/about_our_earth/about_freshwater/freshwater_problems/thirsty_crops/cotton/

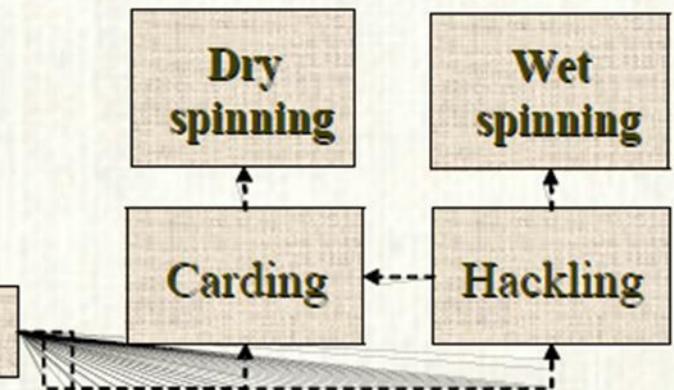

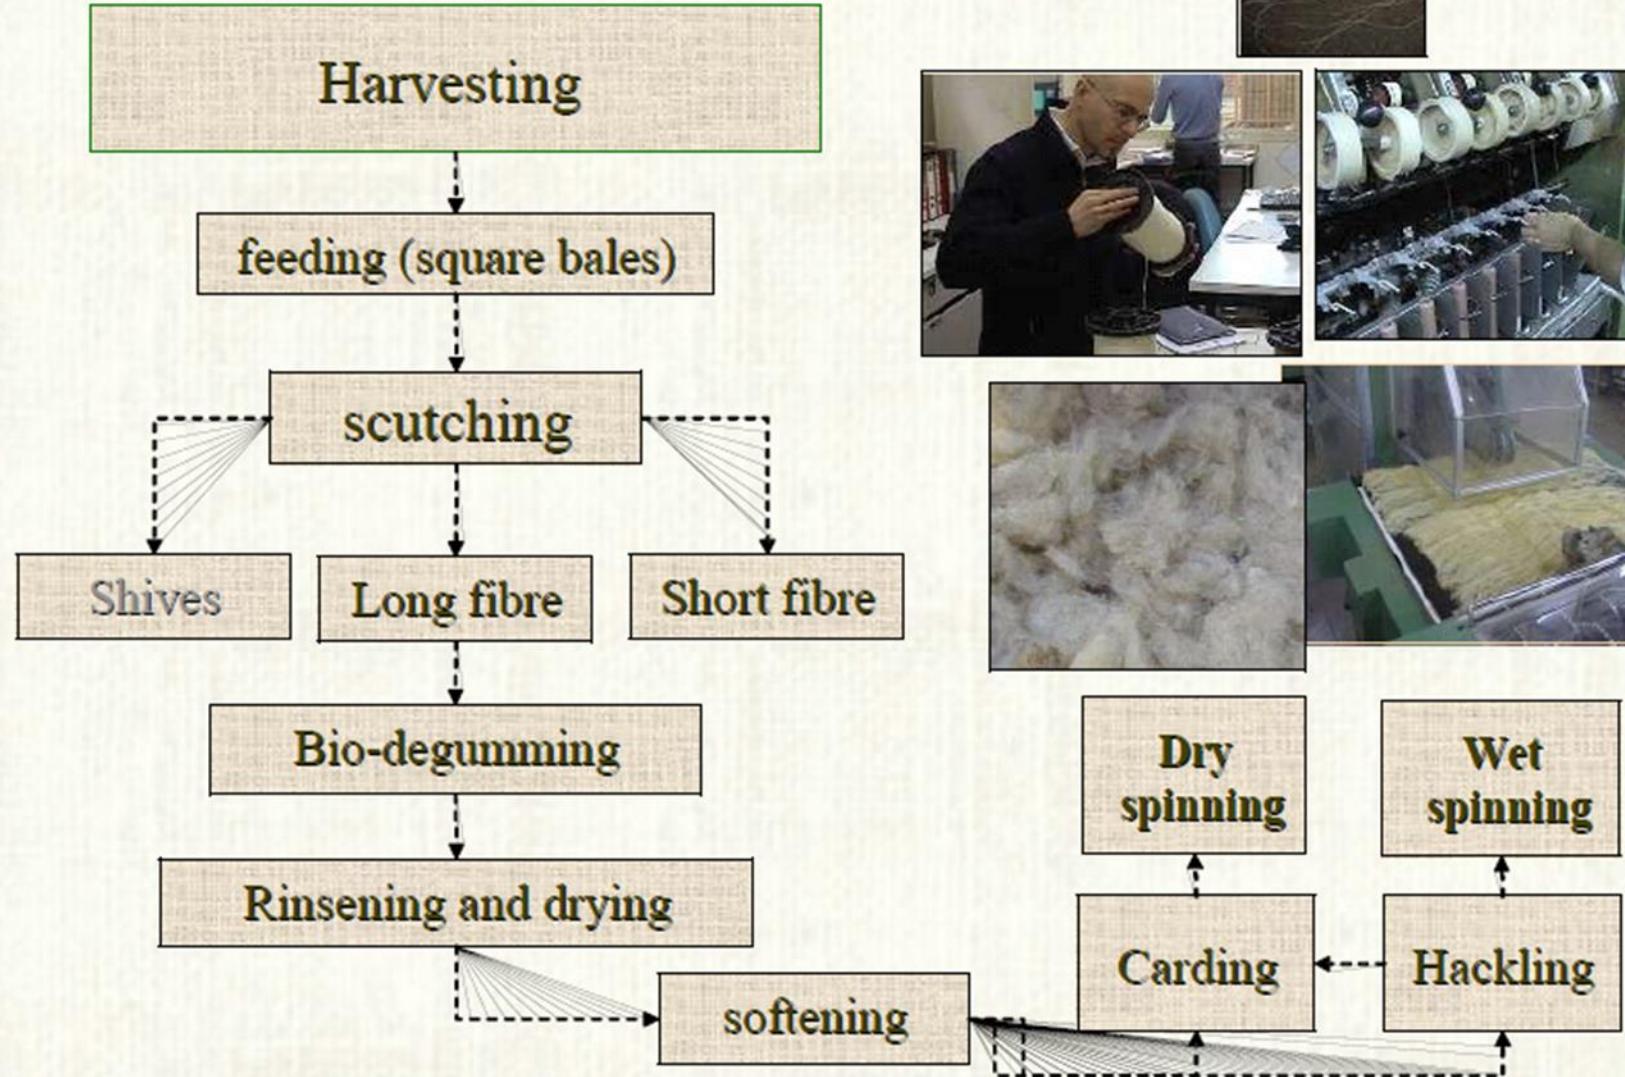

Not sustainable hemp processing

Many attempts to solve the challenges with hemp for textiles

- The textile and fashion industry demands trackability and transparency in the hemp production
- The old hemp industry have been phased out in most countries of Europe
- The hemp industry have been renewed and are strong in processing hemp for insulation, composites and other nonwoven products
- But the hemp alternative for textile is not yet there???
- Lots of projects targeting the textile track – but are still not scaled up and on the market, the prices are very high, the quality differs and is very limited
- The of stream industries such as carding and spinning are limited
- Only very little hemp for textiles produced in Europe is available

Udviklingsprojekt – bæredygtige hampetekstiler

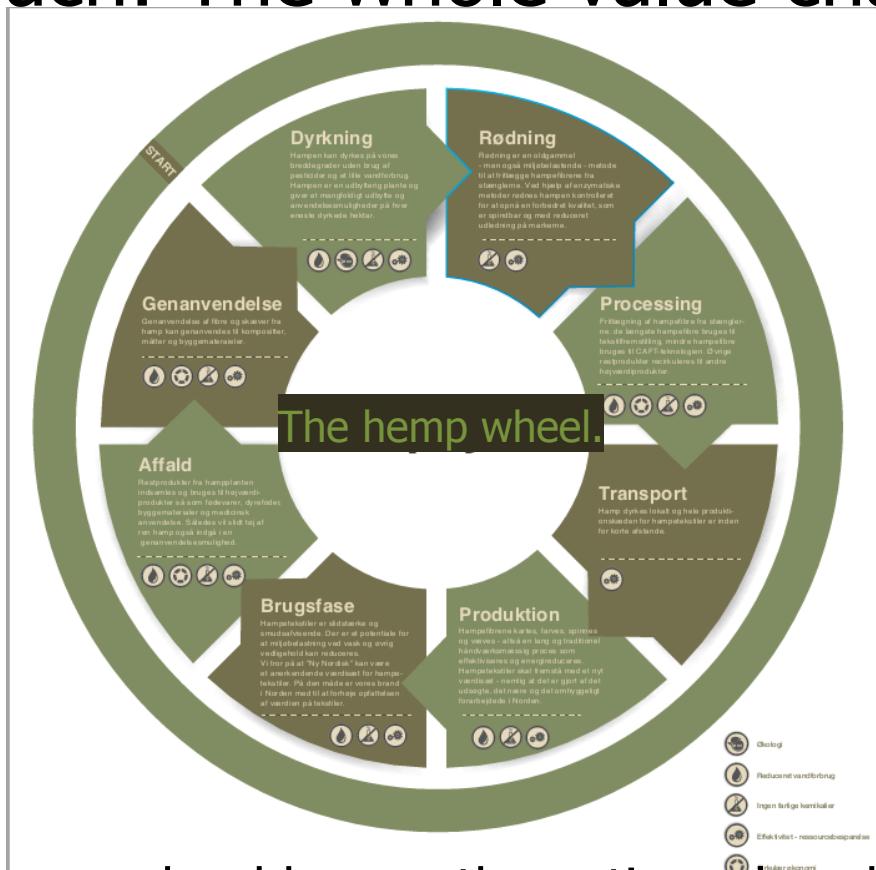

Goals of the Danish Hemp Textile project (DTI)

- The goal of the project is to pave the way for a real Nordic production of sustainable hemp textiles of durable, sustainable high quality fabric based on hemp fiber.
- A scalable process combined with enzyme-treatments
- Controlling the retting process and achieve high textile fiber quality
- The project will at the same time demonstrate that with the new technologies there is a high resource utilization throughout the value chain and the possibility of using the entire raw material, avoiding waste and upcycle after use.

Approach: The whole value chain

- The approach addresses the entire value chain from commodity production and processing using new innovative technologies and solutions to end users, ie. ranging from the field of raw materials production, processing of raw materials into long textile fibers, spinning for yarns and transformed to fabrics and sample designs for the fashion and furniture industry.

Experiments with cultivation, harvesting and handling of the hemp stalks including innovative scalable scutching methods

Rødningsgrad essentiel til tekstile formål??

Hackling of hemp stalks (15 cm)

Characterization and test of quality of the treated hemp fibers

- Tensile strength
- Degree of release - via microscopy
- HPLC-analysis of sugars in enzyme water. Loss during process
- Fiber yields – long fiber and fiber-share
- Fiber lengths - long fibers, short fibers
- Carding and spinning tests for making yarns
- Finishing - Bleaching
- Fabric of knitted and woven items
- LCA
- Etc.

Enzyme retted hemp – hackled and below also carded

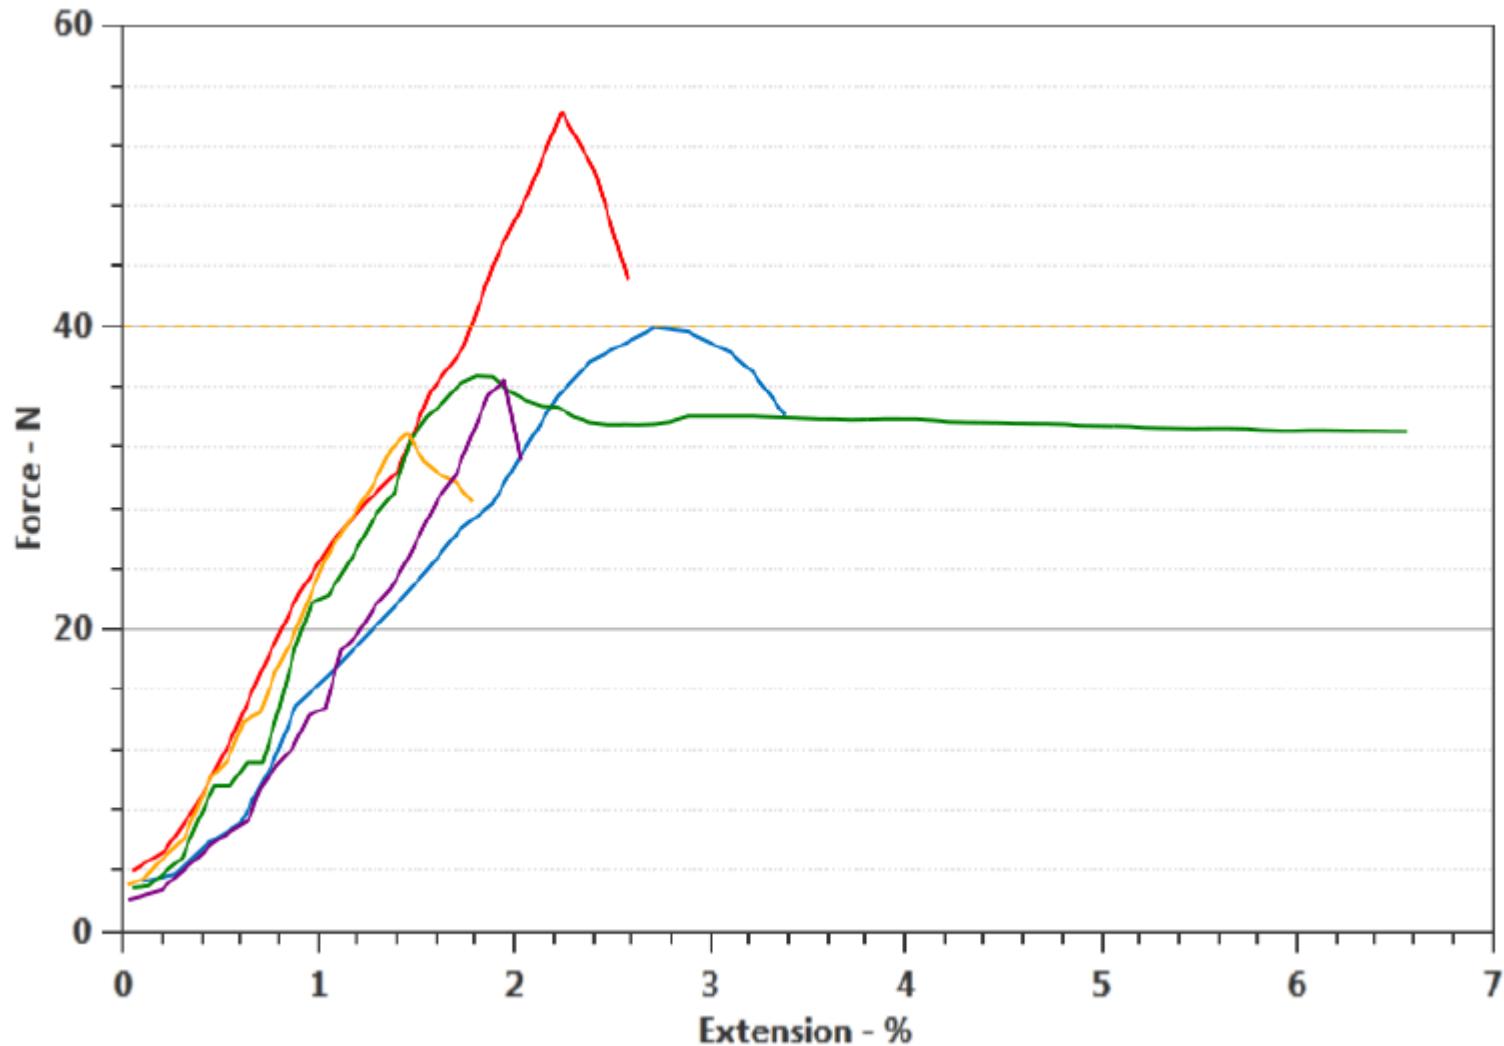

Samples of enzyme waste water for HPLC tests and fiber analysis

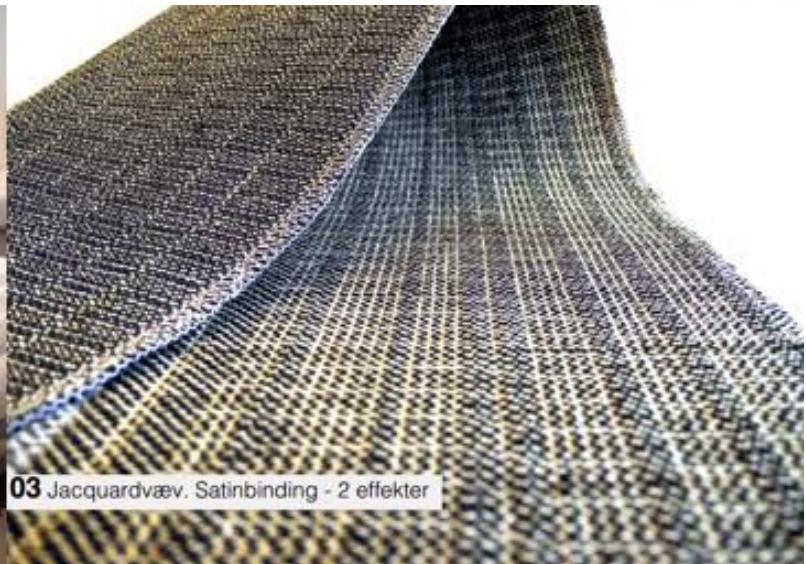

- Cellulose
- Hemicellulose
- Lignin
- Glucose (cellulose)
- Xylose (Hemicellulose)
- Lactic acid
- Acetic acid
- Ash
- Protein
- The fat / wax
- Etc.

Strength of fibre – Force N and Elongation at max force

Outputs:

Cover stocks and fibertex-products

- Using a game-changing technology at Advance Nonwoven, Danmark
- Patented CAFT-technology

Non-woven products

- Replacement of non-woven synthetic products from fx. Fibertex – and other cover stocks

Development and optimization of prototypes of woven fabrics in new sustainable designs with hemp fabrics for testing in the textile industry.

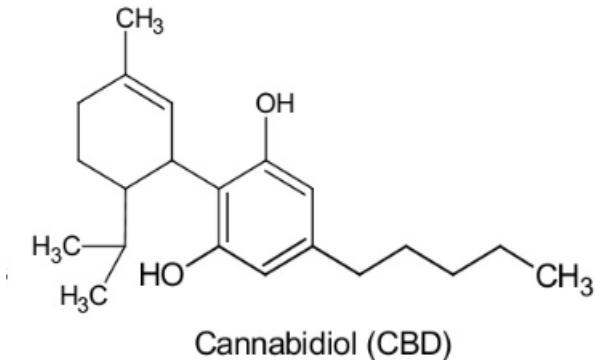

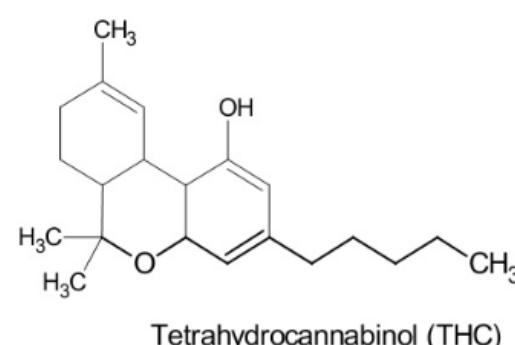

- Research with carding of hemp fiber and spinning of hemp yarns.
Analyzes of yarn grades
- Creation of sample designs of textiles.
- Research with Bio-polishing to improve the quality of the textile
- Processing of fibers to finished yarns that can be woven into fabrics.
- Manufacture of woven textile prototypes
- Preparation of prototypes of substances in various mixtures with hemp and for example. wool.

Conclusions – it's a challenge

- The retting process can be controlled by alternative retting methods such as enzyme retting and other methods providing a strong fiber quality of long fibers for textile purposes – which industry demands
- Raw material quality in green hemp high. Optimization of the cultivation issues such a variety, plant density etc. will be solved.
- The processing need to be scalable and less labor intense
- Introducing a wet process creates costs, that need to be covered by higher prices.
- Innovation and new ways of handling the hemp straw in harvest is essential for a success
- Designers and innovative end-users are involved in the process, giving a driver for the development work
- As well a positive attention from the fashion industry demanding more sustainable solutions
- Cooperation with players in the hemp processing industry essential as well

Bioaktive stoffer i hamp – Cannabis sativa

- Cannabinoiderne er de aktive stoffer, der findes i cannabisplanten – særligt blomster og blade. Der er mere end 104 forskellige cannabinoider i cannabis, herunder cannabidiol (CBD) og delta-9-tetrahydrocannabinol (THC), som de mest kendte.
- Den første cannabinoid-receptor, CB1, blev identificeret i hjernen i 1990.
- En anden cannabinoid-receptor, CB2, blev identificeret i 1993. De fleste CB2-receptorer findes i celler, der indgår i immunforsvaret, hvilket tyder på, at det har en funktion i dette.
- Man har desuden identificeret cannabinoider i kroppen, der kaldes for endocannabinoider. Det tyder på, at disse kan spille en rolle i forhold til oplevelse af smerter, bevægelseskontrol, sult og hukommelse.

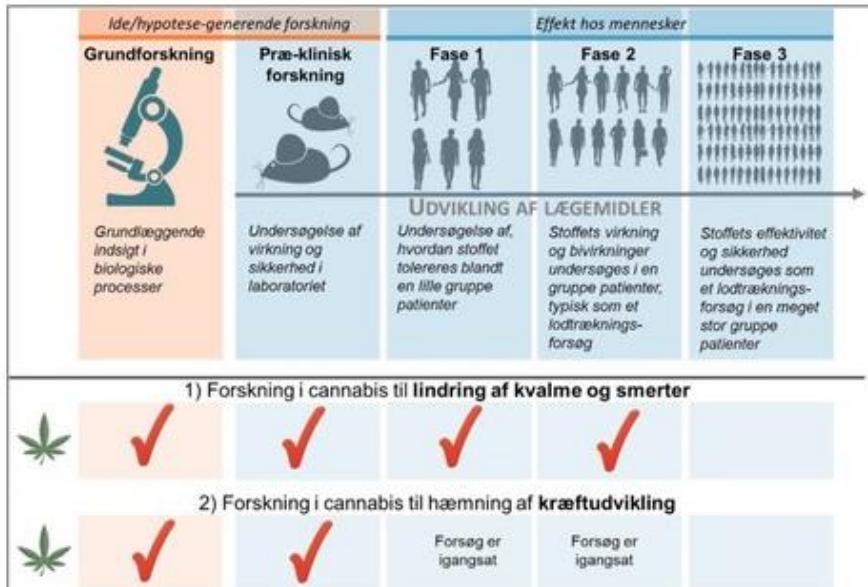

Effekter af de bioaktive stoffer – hvoraf nogle er dokumenteret andre er ikke i tilstrækkelig grad

CBD

- kvalme og opkastning efter kemoterapi, appetitstimulation ved HIV/AIDS, kronisk smerte, antiinflammatorisk

THC

- Smærter, kvalme, uønsket vægtab, spisevægring, sklerose, nervesmerter og spasticitet m.fl.

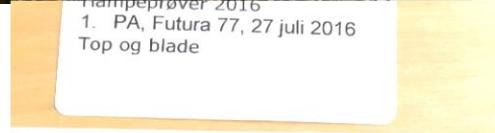

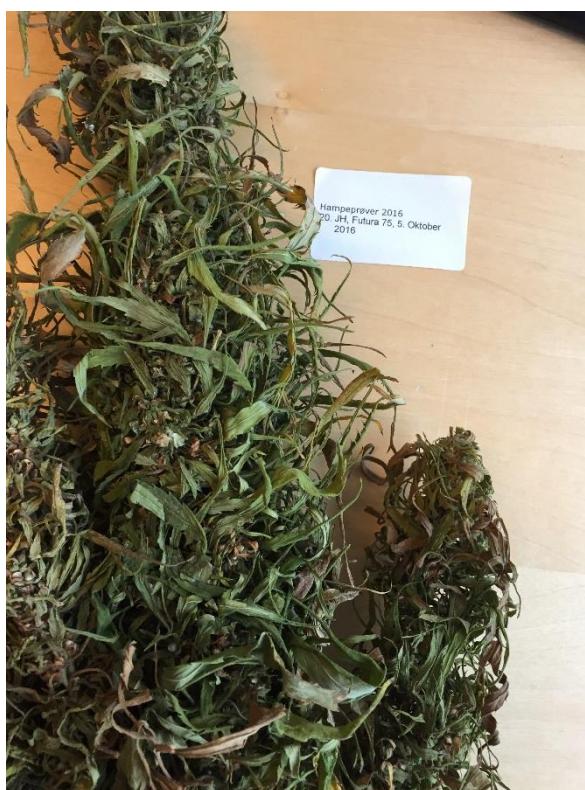

Fra bl.a. www.cancer.dk
www.eiha.org

Resultater fra projekt under Grøn Omstilling – Erhvervsstyrelsen – højværdistoffer i udvalgte planter, bl.a. hamp

- Indhold af CBD og THC i hamp afhænger af sorter, dyrkningsmetode, konserveringsmetode og ekstraktionsmetode
- Projektdeltagere en række private virksomheder og landbrug samt Teknologisk Institut - AgroTech samt SDU
- Uddrag af resultater med bestemmelse af THC og CBD i hampesorter 2015 og 2016

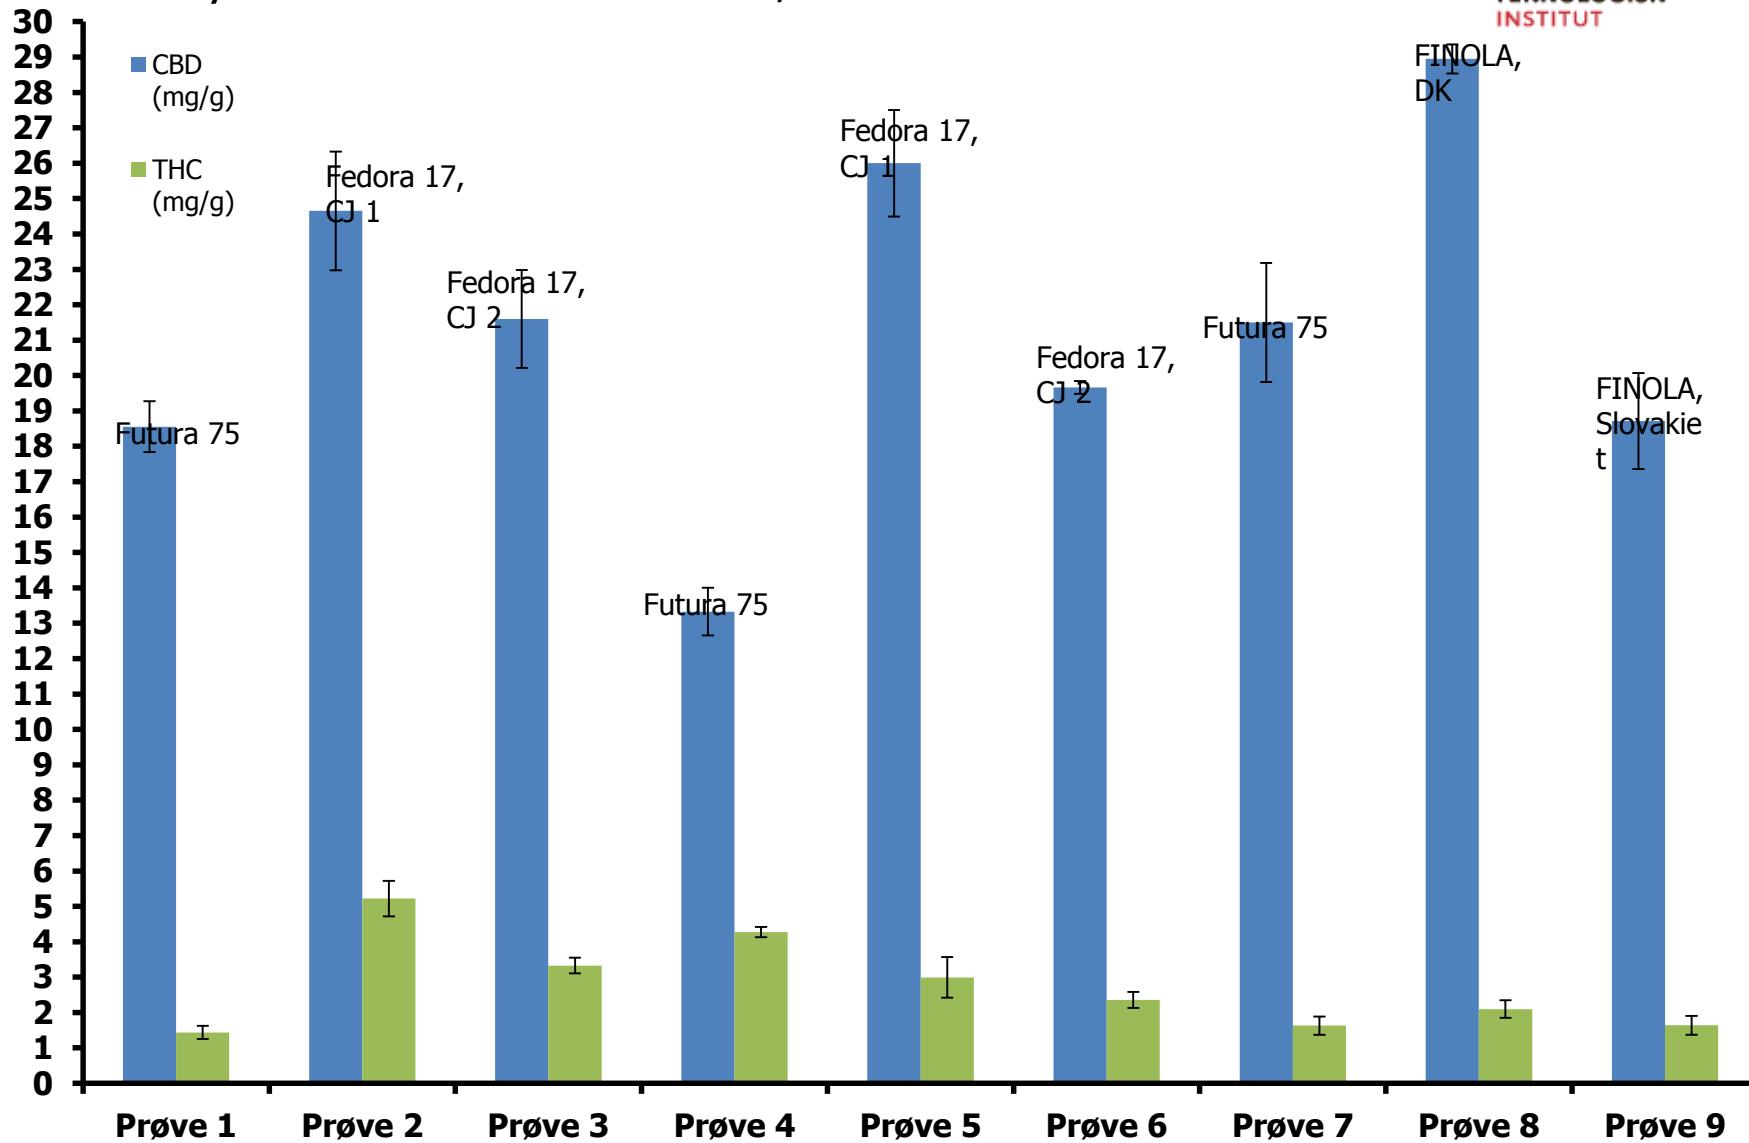

- Vi skal vide hvor indholdsstofferne kommer fra og hvordan de er dyrket, kontrolleret produktion – som vi kender fra vores fødevarer.

Råvarer - eksempler

Hampeprodukter fra Møllerup Gods - fremstillet af frøene

TEKNOLOGISK
INSTITUT

Hamp er rig på:
PROTEIN • OMEGA • FIBRE

Hamp har et højt indhold af protein, hampefrøene indeholder 25 g pr. 100 gram. Hampen er rig på omega 3 ALA men også omega 6 fedtsyrén GLA. Endelig er hamp rig på kostfibre, magnesium, jern, zink, vitamin B1, B2, vitamin E og vitamin D.

Hamp er et superfood

På Møllerup Gods arbejder vi med hamp og hampens unikke ernæringsmæssige egenskaber. Resultatet er en række gode produkter, du kan bruge til hverdag og fest.

God appetit

Besøg vores hjemmeside for inspiration og opskrifter. Du kan også se og kope produkterne på: www.moellerup.dk
Sælges også ved udvalgte forhandlere.
